# L'APPAREIL LOCOMOTEUR

## I. INTRODUCTION

## II. SQUELETTE OSSEUX

### 1. Os :

## 2. Articulations :

2. Articulations :  
(→ les points de contact entre deux ou plusieurs os)

**Types**

2.1. Articulations mobiles :

- Emarthrose (sphérique) 
- Condyléenne (Ellipsoïde) 
- Sella 
- Ginglyme - Trochléenne 
- Trochoïde (cylindrique) 
- Arthrodie (Plate) 

2.2. Articulations peu/semi mobiles - Amphiarthrose

2.3. Articulations immobiles - (soudure par exemple) = Synarthrose

**Composition**

a - Surfaces articulaires : 

b - Capsule articulaire :

c - Ligaments :

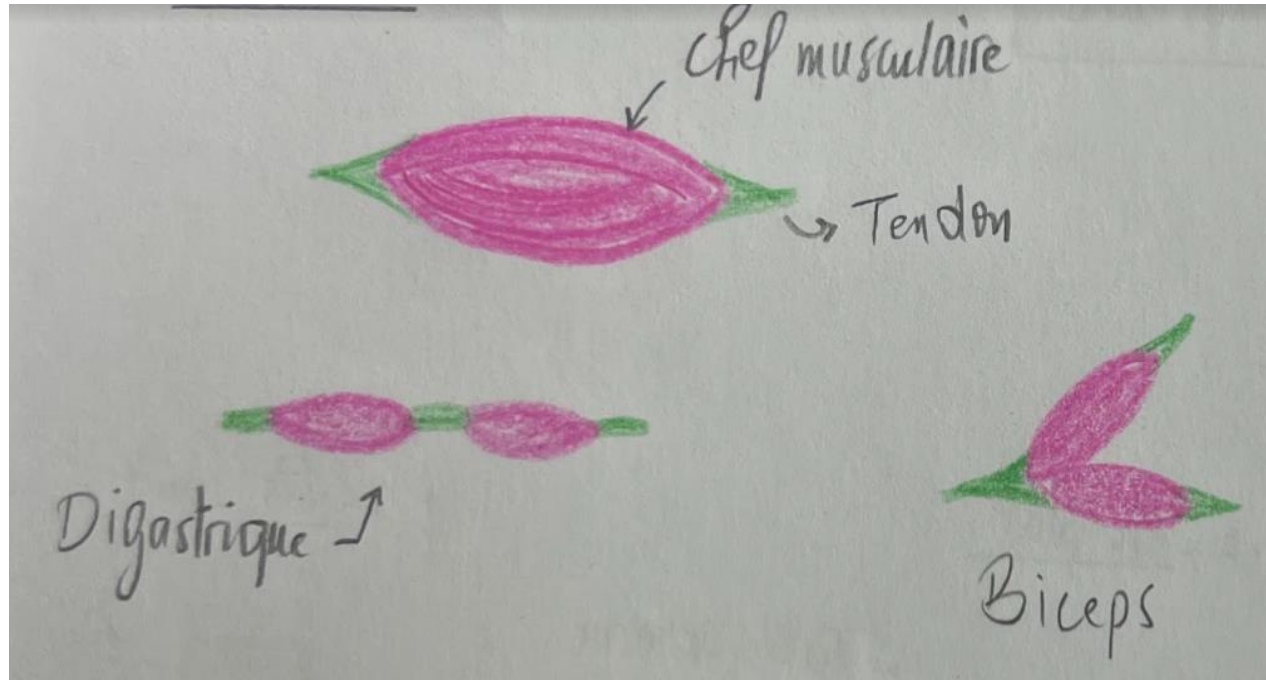

d - Membrane synoviale :

**des mouvements :**

- Flexion (diminuer l'angle)
- Extension (l'augmenter)
- Abduction (s'éloigner de l'axe centrale)
- Adduction (s'approcher)
- Élévation (s'approcher vers l'ext. supérieure du corps)
- Abaissement (s'approcher vers l'ext. inférieure du corps)
- Supination 
- Pronation 
- Rotation

**N.B. :** Entorse est un surétirement des ligaments qui contiennent une articulation

### III. MUSCLE

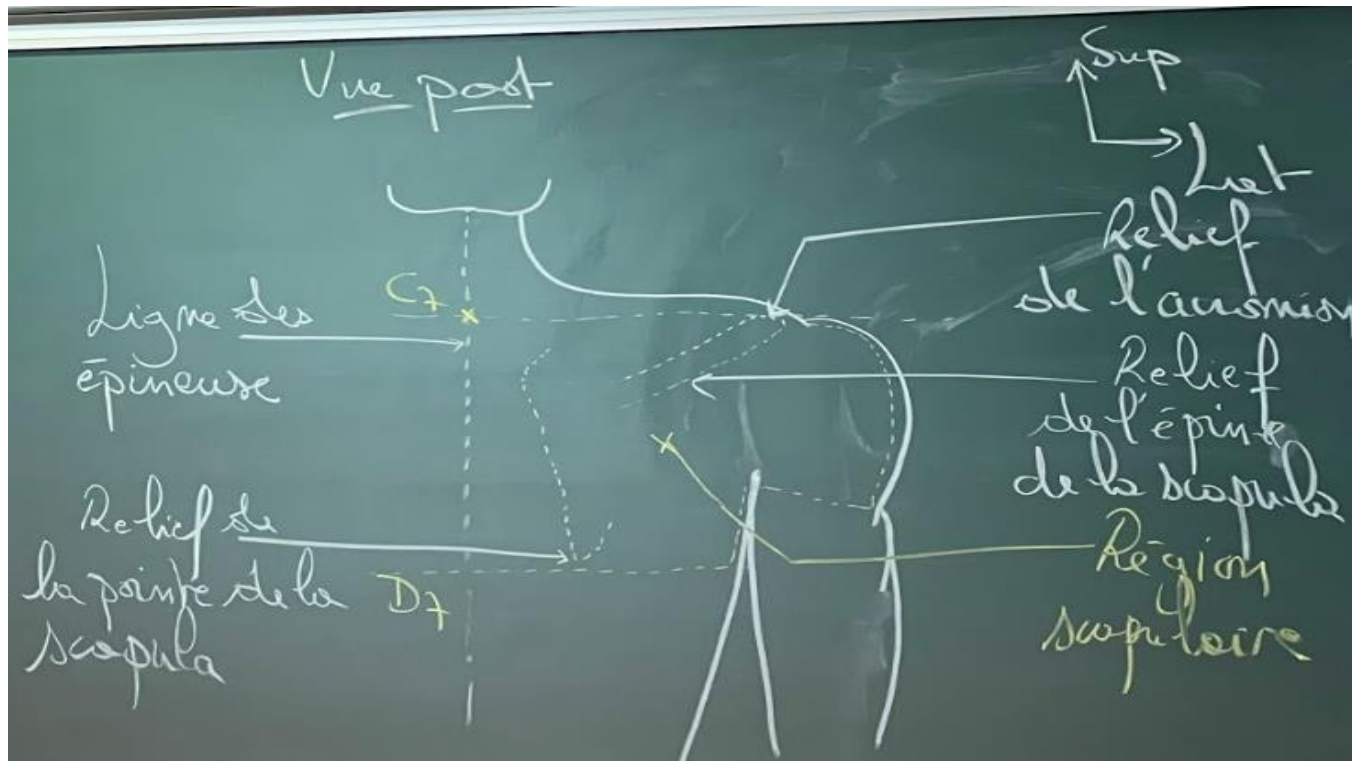

### IV. ELEMENTS NOURRICIERS ET DE CONTROLE

- Vascularisation
- Innervation
